

CMMS Data Migration and Data Conversion

When switching from one CMMS to another, your CMMS data migration and conversion is key to a successful implementation. We offer a comprehensive data conversion and migration process that allows you to incorporate existing data into your FSI's CMS.

Feel Confident in your Data

Over the last 18 years, we developed an exceptional ability to migrate existing information from legacy systems to our CMMS.

We regularly import data from other maintenance management software programs such as:

- Accruent
- Archibus
- Bigfoot CMMS
- Datastream
- EAM
- Infor
- Mainspring
- Maintenance Connection
- Maximo
- MP2
- SiteFM
- St. Croix
- TMS
- TMA

During data migration and standardization, our teams typically convert equipment information including:

- Manufacturer
- Model
- Serial number
- Warranty information
- Preventive maintenance procedures and schedules
- Work orders
- Previous maintenance histories
- Additional information available in the originating database.

Data Cleansing

Our experienced data migration teams bring over 18 years of Best Practices to your organization. We'll analyze your existing CMMS data with you, then determine how and where to "clean up" your existing data to give you the most relevant, accurate data possible.

If your CMMS database has information that's no longer valid, like unused cost center accounts, employees who are no longer part of the organization, or unused vendors, we can remove those for you.

Archive Data

If your organization wants to keep only a certain amount of historical data your their new CMMS, we'll archive older data – keeping it easily accessible for future reference.

This allows you to only view and sort through the most relevant information without losing access to historical data.

Data Standardization

Data conversion is the best time to standardize nomenclature throughout your CMMS database. Over the years, data entered by different team members can cause inconsistencies in the data.

Standardizing items will enable more accurate, efficient reporting for your department across:

- Work order types
- Asset categories
- Naming conventions
- Vendor information
